

Business Requirement Document

Business requirements for the IT support analytics solution

1. Purpose

Define a repeatable analytics solution that converts raw IT support ticket descriptions into structured priority, urgency, operational-risk insights, and decision-ready Power BI reporting.

2. Business Problem

Raw support tickets contain operational information in unstructured text. The solution standardizes the data, enriches tickets with priority and risk attributes, stores the results in MySQL, and presents the analysis through Power BI.

3. Objectives

- Process and standardize 47,837 tickets.
- Classify tickets as Low, Medium, or Critical.
- Generate urgency scores and operational-risk indicators.
- Store enriched records in MySQL for reusable SQL analysis.
- Deliver a three-page Power BI dashboard.
- Maintain a reproducible end-to-end workflow.

4. Business Questions

- What does the overall IT support workload look like?
- Where is priority and operational risk concentrated?
- Which ticket groups deserve investigation or action?

5. Scope

In scope: inspection, cleaning, deterministic classification, urgency scoring, risk indicators, MySQL storage, SQL views, DAX KPIs, Power BI reporting, documentation.

Out of scope: live service-desk integration, SLA prediction, production NLP deployment, and live alerting.

6. Success Criteria

- 47,837 source records processed and retained.
- 0 final enrichment failures.
- Enriched data queryable in MySQL.
- Three coherent analytical dashboard pages.
- Reproducible documentation and code.
