

ER Diagram & Data Model

Logical relationship model for the MySQL analytics database

1. Logical Model

The central ticket entity stores ticket-level facts. Category and priority are represented through IDs and relationships, while urgency and operational-risk indicators remain ticket attributes.

CATEGORIES	TICKETS	PRIORITIES
category_id (PK) category_name	ticket_id (PK) document category_id (FK) priority_id (FK) urgency_score risk indicators classification fields	priority_id (PK) priority_name

2. Relationships

- Categories 1 → many Tickets through category_id.
- Priorities 1 → many Tickets through priority_id.

3. Design Rationale

IDs separate descriptive reference values from ticket-level records and make the relational model easier to maintain and query. Analytical views provide a reporting-friendly layer for Power BI.
