

Findings & Recommendations

Key results, interpretation, and practical recommendations

1. Executive Summary

The dataset contains 47,837 IT support tickets across eight categories. Hardware and HR Support are the two largest categories. The final rules-only enrichment processed every record successfully and created structured priority, urgency, and risk attributes.

2. Category Distribution

Category	Tickets	Share
Hardware	13,617	28.47%
HR Support	10,915	22.82%
Access	7,125	14.89%
Miscellaneous	7,060	14.76%
Storage	2,777	5.81%
Purchase	2,464	5.15%
Internal Project	2,119	4.43%
Administrative rights	1,760	3.68%

Hardware is the largest category at 13,617 tickets (28.47%), followed by HR Support at 10,915 (22.82%).

3. Priority Profile

Priority	Tickets	Share
Low	45,911	95.97%
Medium	1,605	3.36%
Critical	321	0.67%

Critical tickets represent 0.67% of the dataset, while most tickets are classified as Low priority.

4. Risk Signals

- 321 Critical tickets.
- 317 security-related tickets.
- Average urgency score: 14.02.
- Maximum urgency score: 85.
- 321 tickets meet the high-urgency threshold of 70.

5. Recommendations

- Monitor critical and security-related tickets separately from overall workload.
- Investigate categories with high work-blocked, business-critical, deadline-driven, or service-unavailable concentration.
- Use the dashboard as a triage aid, not as a replacement for human assessment.
- Add human-labelled validation before production use.
- Future versions can add SLA, resolution-time, confidence, and historical-trend analysis.

6. Limitations

Priority and urgency outputs are engineered analytical classifications based on available ticket text and should not be treated as ground truth or contractual SLA severity.
